Group 1 | Omnisound | Project Session 4

Aspect of the concept	Design questions	Answers
Idea	What is the product or service for? *-- (an identifiable whole from the perspective of users or other stakeholders)*	A web-interface prototype for finding, saving and resuming music, podcasts and audiobooks in one place, while keeping the audio types clearly separated.
	What is the name of the concept?	Omnisound
Who	Who is the product or service for?	Students who regularly use music, podcast or audiobook apps, including mixed-content listeners and mainly music listeners.
	Who is affected by it (short term/long term)?	Short term: target listeners and project participants. Long term, if launched: content creators, publishers and platform operators.
What	What is the main function?	Find audio through shared search, save it in one library and resume unfinished podcasts or audiobooks from the saved position.
	What is the most important content?	Sample audio items with titles, creators, cover images and type labels; saved playlists/items and listening progress.
When and where	In which social contexts and in which physical environments can the product or service be used?	Proposed use: personal listening at home, during study breaks or while travelling. The first prototype focuses on a browser-based interface.
How	What principles does the product or service follow?	Visibility: clear categories and progress. Feedback: show action results. Consistency: familiar labels and controls. Recognition: visible items.
	What qualities are sought?	Effective, efficient and easy to learn, with the necessary functions. The experience should feel helpful, organised and satisfying, not cluttered.
	What types (or kinds) of design options are available?	Compare category tabs with a mixed feed plus filters, and list with card views. Start with lo-fi sketches; develop an interactive hi-fi version.
Why	Why is the product or service used?	To find and return to wanted audio without repeatedly searching separate libraries, while keeping each content type easy to recognise.
	What problem or question does it answer?	Working problem to validate: listeners may lose track of saved or unfinished audio, while combining content can make navigation feel crowded.
Consequences	How are people, the environment, society, or the environment affected by it?	May simplify listening, but clutter or poor accessibility could exclude users. Privacy, rights and environmental effects need assessment before a real launch.
