Usability Test

Emin Zerman

2025-10-09

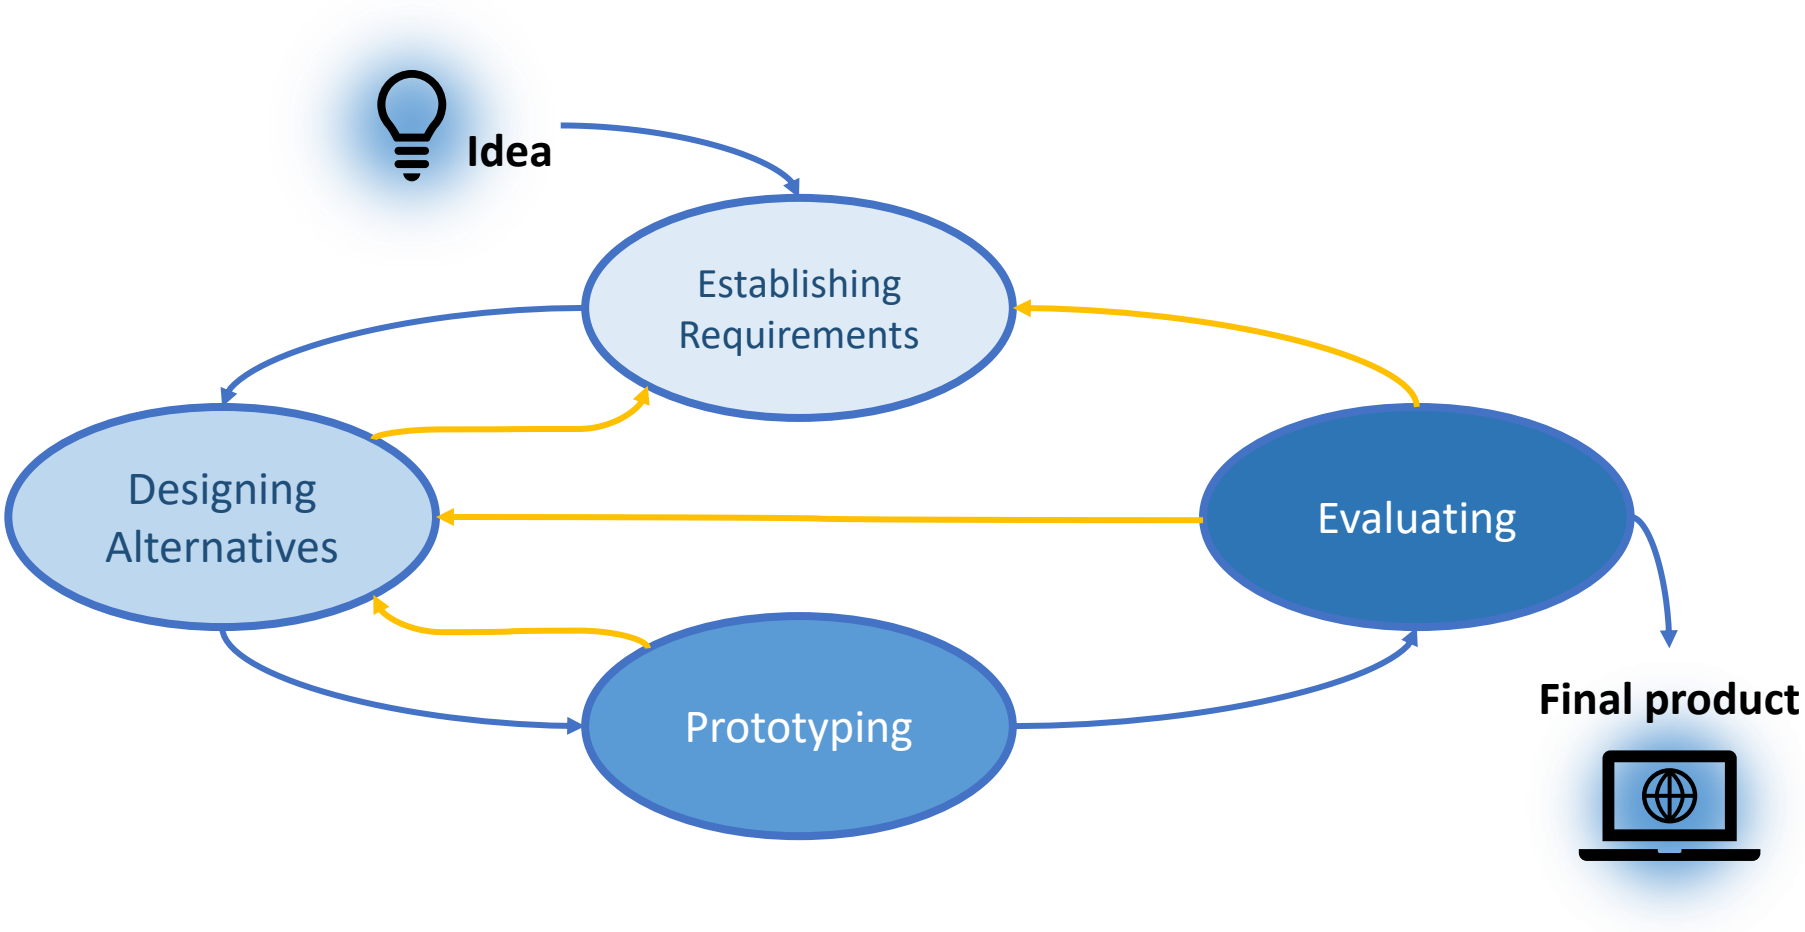

Project Work – So Far

- Form groups of 3-5 people
- Come up with a project idea. What problem or need are you going to solve?
- Think about who your target group is.
- Performed data collection (interview/observation/survey)
- Develop use cases, scenarios and/or personas .
- List functions that should be in your design.
- Prioritize and focus on the most important functions

- Created lo-fi and hi-fi prototype

Design Process

Preece, J., Sharp, H., & Rogers, Y. (2015). **Interaction design: beyond human-computer interaction**. John Wiley & Sons.

Timeline

	Mon	Tue	Wed	Thu	Fri
v38	Project start (C015 and C016, ALC) →				Data collection (M209)
v39	→		Data analysis (M209)	→	
v40	→				
v41	Prototypes (C015 and C016, ALC) →			Usability tests (M209)	
v42					
v43					
v44			Presentations	Presentations	

Usability test process

Anything to do before?

Usability Test

Or after?

- We wish to find out the usability of the system
- There could be requirements which were not captured
- Perhaps, some parts that needs to be polished

Usability test process

Before the test:

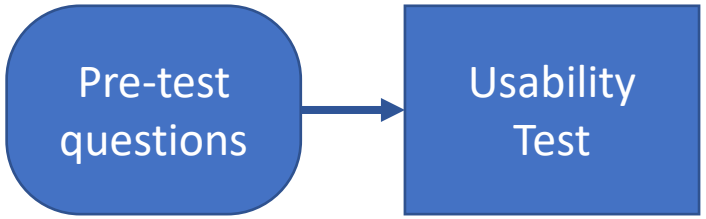

- Develop a Plan
- **Recruit** test users
- Prepare
  - Informed consent
  - Pre-test questions

Usability test process

Plan

Recruit

Prepare

Informed Consent

The participant needs to have the right expectations of what will happen. Informed consent means that participants understands what is going to happen, and what is expected of them.

Also …

Informed Consent

In summary, informed consent means that participants understand:

- that they **agree** to participate in the study
- that participation is **voluntary**
- that they agree to **speak up** immediately if they wonder about something or feel uncomfortable
- that their interaction is **observed** and possibly recorded
- how the **results** will be used
- that they will be **anonymised**

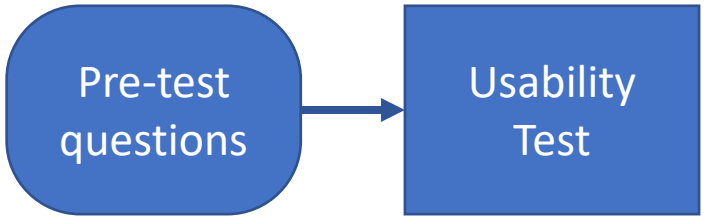

The informed consent can be oral or written.

Usability test process

Plan

Recruit

Prepare

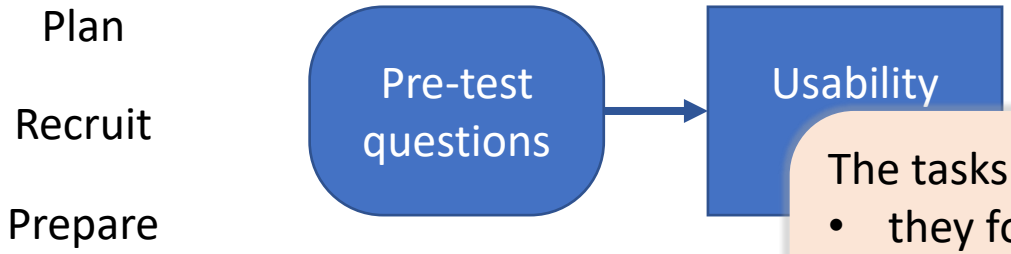

Pre-test questions

Before the test, it is customary to collect some data about the user.

E.g. gender, age, education, computer skills, language skills, etc. (or others that are relevant for your test).

You can also ask about first impressions or ask the user to describe the components they see in the interface.

Usability test process

The tasks must be formulated so that
- they focus on what the user should achieve
- without describing how.

e.g., You are looking for the book Interaction design by Mattias Arvola. Find the book and get in line to borrow it.

During the test

- The **test leader** leads the test
- The **user** is asked to think aloud while they solve the task (think-aloud method).
- **Observer** sees and records what the user does and says.
  - *For example, which paths the user takes through the prototype, success and difficulties, behaviors that show that the user does not understand.*

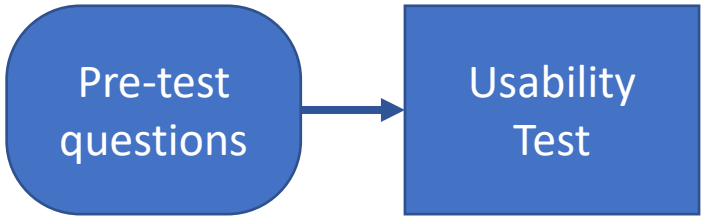

See pdf in Moodle "Exercise: Evaluating Usability"

Usability test process

Plan

Recruit

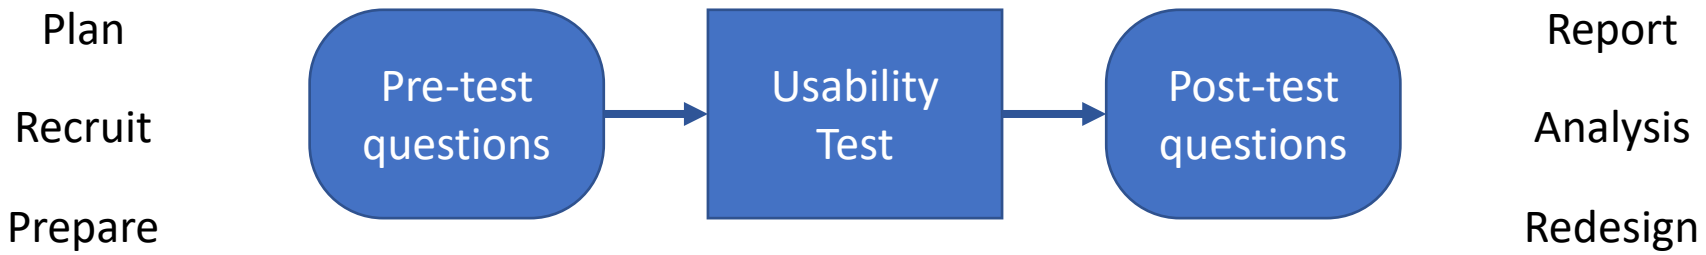

Prepare

After the test

- Post-test questions
  - Collect user impressions and thoughts. For example, overall impression, what was good, what was bad, what can be improved, what is missing, other comments.
- Describe the approach in the Report
- Analysis (see the data analysis exercise)
- Redesign

Usability test process

After the test

- Post-test questions
  - Collect user impressions and thoughts. For example, overall impression, what was good, what was bad, what can be improved, what is missing, other comments.
- Describe the approach in the Report
- Analysis (see the data analysis exercise)
- Redesign

Expert evaluation (*complement to usability testing*)

Evaluate your prototype with Nielsen's 10 principles of usability:

1. Visibility of system status – *Provide feedback to the user*
2. Match between system and the real world – *Avoid jargon*
3. User control and freedom – *Suggest, never impose*
4. Consistency and standards – *Promote uniformity*
5. Error prevention – *Prevent errors*
6. Recognition rather than recall – *Minimize user memory load*
7. Flexibility and efficiency of use – *Enable personalization*
8. Aesthetic and minimalist design – *Simple and natural dialogue*
9. Help users recognize, diagnose, and recover from errors – *Clear messages*
10. Help and documentation – *Help users understand how*

Exercises for today

Two exercises today:

1. Usability test for a given topic

2. Usability test for your project

Usability Test – Exercise #1

Work in groups of 3-4 people

- 1-2 users.
- 1 test leader
- 1-2 observers (The observer can also measure e.g. time and number of clicks.)

Website: http://www.uppsala.se/

Tasks:

1. You must apply for housing adaptation grants for a person with a disability.
2. You have an acquaintance who drinks too much. You want to call the municipality's alcohol group and get advice.
3. You must apply for home care.

Remember: Observer takes notes

Usability Test – Exercise #2

Work in your project groups.

1. Prepare a usability test for your product.
   - What are the tasks?
   - What are the measures? (e.g., number of clicks, seconds until action,
   - Who is the leader/observer?

2. (Pilot) Test on someone from another group

Continuation of the project

- *Who is your target group?*
- *What usability and user experience goals do you think the target audience wants with this interface? Look for inspiration in, for example, current apps (which don't even need to have similar functionality).*
- *Discuss the different data collection methods and decide how you will collect data to verify the usability goals with the target audience.*

Don't forget to take notes!
